

MUSICIANS THROUGHOUT THE WORLD PLAY WHAT YOU WANT TO HEAR WHEN YOU PLAY

Jazler Software presents Jazler24! Based on the experience of 12 years and the new technologies of Microsoft, Jazler24 is the best solution for automated music playback in open places, hotels, restaurants, cafes, and generally for professional and semi-professional applications, or even for in-house parties and entertainment!

Jazler24 will play the music you desire, the time and days you program it to, making the best choices from the available songs, trying to avoid same artist repetition, getting all the songs at the same volume, and mixing them as you would hear them in the radio.

Features of the new Jazler24

The new Jazler24, except its totally new user interface, improved from previous versions, has new features and goodies like...

- ✓ **drag'n'drop** Simply drag the songs to change their airplay position or to insert them to the playlist directly from the song database screen.
- ✓ **Intellivolume** The new AGC algorithm of intellivolume normalizes all your audio content to the same audio output level without the 'compression' effect, resulting to a "smooth" airplay.
- ✓ **avoids artist repetition** as more as it can and as realistically as it can from one side avoiding artist repetition but also avoiding a "robot-like" music playback
- ✓ **programmed «silence»** especially useful for malls that need their music to stop at night and automatically start in the morning
- ✓ **mini music scheduler** that can program what hours, days and in what sequence you want your audio folders to be played
- ✓ **automatic detection of changes in your audio folders** Jazler24 will detect automatically the changes in the background, will analyze the new songs and create mix times so it can mix them with the other songs as best as possible
- ✓ **new semi-auto status** provides the ability to assign the F2 to F12 keyboard buttons to specific audio folders to play them automatically for "ad-hoc" access to these folders
- ✓ **brand new user interface** based on the new Windows Presentation Foundation technology of Microsoft, that uses all the features of your graphics card providing a new music experience!

*Music is not only what you play, it's also the way you play it!
Traditional media players play audio files. Jazler24 plays music!
Plays music like it should be heard!*

Jazler24 in more detail

Jazler24 does not have a traditional database. It is based on the folders you have in your windows system!

You just select the folders you want Jazler24 to "watch" at and Jazler24 will project these folders as song categories.

Schedule the music folders you want to hear throughout the day and week

Jazler24 is based on 'time shifts'. In every time shift you create, you can specify what folders will play, and in what sequence. Jazler24 will also state in text the music will be heard in this specific time shift.

*Do your songs have different volume levels? **Not anymore!***

The intelligivolume feature of Jazler24 will try to play the songs at a stable volume level. It will analyze the song while it's being played and will adjust it to the right level, loud and clear, without the compression effect of a traditional compressor-limiter.

When idle, a big title displaying the current song playing is shown in the center of the screen

Jazler24 checks out to see if you are using the computer. If not, every time a new song begins, Jazler24 will show you a big title with the new song for 10 seconds. If the mp3 playing has the album photo embedded, it will show that too!

What happens when in some time of the day, you don't want to hear the scheduled program but a specific folder?

For this reason we introduce the brand new semi-auto function. You can assign the F2 to F12 buttons of your keyboard to different folders and sequences and call them whenever you want. When you want to go back to the scheduled program, just press F1.

Jazler24 gives you the choice to assign sequences of folders to each F key, so you can play whatever you want, whenever you want!

Programmed Silence!

Silence is gold! There are the times we do not want Jazler24 to play music, but we can't be over it every time we want to change that...

Open places, shopping malls, squares, hotels, organized beaches, resorts, parks need automated silence when they are closed or in hours of public silence. Jazler helps on this problem with the programmed silence function, so you won't worry every time you have to turn it on or off again!

Detailed logging of what has played, and logging of the user actions, so you can explain "unexplained phenomena"!

Jazler24 saves the whole playlist in text files, organized by month, throughout the day, so you can know, what played and when! You can also change the logging format to your own needs. Jazler also logs down (optionally) all user actions (buttons pushed, songs removed or skipped etc.) so you can find out what happened when you were away and someone complained about bad song selection!

Find the song you want to play, in seconds!

Search for the title, the album or the artist typing only its initials. Jazler will automatically filter and present to you the results in milliseconds!

You can find all these features and much more, on your new music player, Jazler24! Let's start rockin!
